Goncharov, A., Chief of the Young Communist League at the

Third Starogrozneft' Oilfield.

TITLE:

A Wide Range of Specializations Should be Mastered (Za ovladeniye

professiyami shirokogo profilya)

PERIODICAL:

Neftyanik, 1958, Nr 7, pp 27-28 (USSR)

ABSTRACT:

In addition to the campaign initiated by young staff members at oilfields, refineries, and other enterprises for limiting petroleum product losses, every effort is now being made to save metal, fuel, water, steam, and electric power, etc. Now they also realize that it is highly advisable to acquire a specialization in more than one field and to be able to handle different jobs. The interruption of the normal course of oilfield operations can be easily avoided if specialists in a certain field of operations are also able to carry out some operations in adjacent fields. The idea of acquiring and combining several specializations is now widespread among young workers engaged in petroleum production, and they are trying to obtain training in different fields so that a carpenter, for example,

Card 1/2

807/92-58-7-26/37

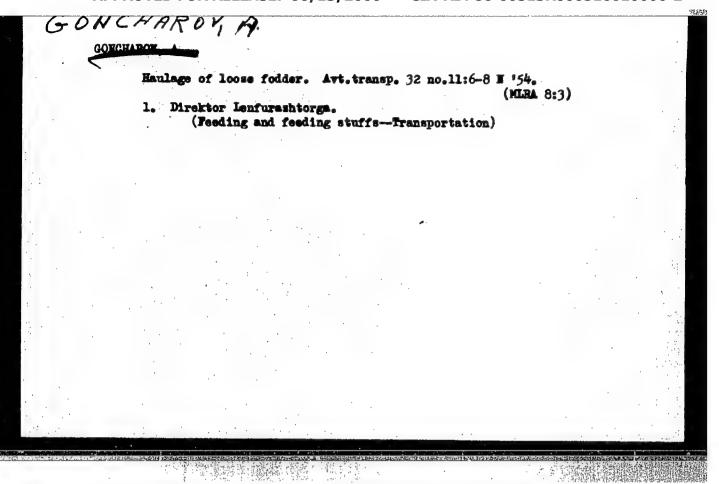

A Wide Range of Specializations (Cont.)

might be able to perform the duties of a derrick assembler, fitter, builder, etc. As a result oil well operations are not interrupted as often as before. By following this new principle the Starogrozneft' Petroleum Production Administration has exceeded its annual production plan, in boosting production and in reducing the cost of operations. It is felt, however, that further efforts should be made in this direction and that well trained specialists should be put in charge of carrying out the educational program set up for young trainees. Moreover, the rate of remuneration of workers specialized in different fields should be revised and made more attractive.

Results of expts conducted over a period of 2 years on 7,330 deer showed that they are susceptible to both the exptl and natural infection with tuberculosis. Although tuberculosis is rarely found in deer on their natural pasturage, the tundra, it is often found among those used as draft animals, Bronchopneumonia of diplococcus etiology is often found

256**T55** 

among young animals. A polyvalent diplococcus vaccine produced encouraging results. These results are not conclusive enough, however. Further stuly of this specific preventive method is necessary.

Transistor switching circuits for magnetic drum

memory heads

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy.

Radiofizika, v.5, no.1, 1962, 165-17

TEXT: The authors apply load-sharing matrices to the problem of read-write head selection on a magnetic drum. After a brief review of the principles a system for 32 tracks is described. No quantitative data are given on perturbations in unselected heads, it being merely said that the circuit "ensures the absence of perturbations in unselected heads". As is the case with load-sharing matrices in selection of core memories, failure of one or two drivers does not derange the selection of the desired head "while the noise in the other channels is insufficient to yield any appreciable signal". There are 5 figures.

TOPIC TAGS: digital computer, triple address system, computer design, computer performance range / TEVM computer, TEVM digital computer

TRANSLATION: The TEVM digital computer was designed for calculations used in planning production technology, including the process and routing of flowsheets based on pre-evolved algorithms. It is characterized by a requirement for storage of a number of element symbols in its memory system. It represents a triple address unit and operates on a system with a comma fixed after 18 digits. The total number of digits in a term is 48 (one number or one command). The operation code is expressed by 6 digits, another 6 digits are used

L 00374-66 ACCESSION NR: AR5013965

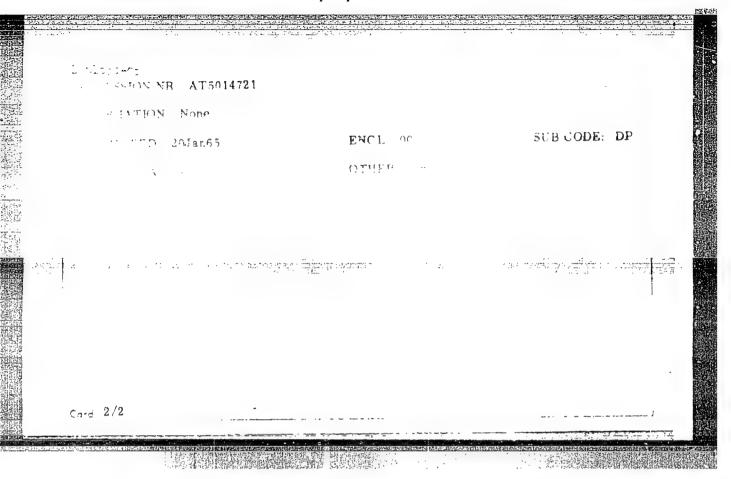

for recording special instructions and the remaining digits are divided between three addresses. The unit is equipped with four memory systems: 1) a magnetic operating memory, capacity 512 terms, rotation period 6 msec; 2) an intermediate memory on a magnetic drum, capacity 1024 terms, average rotation period 10 msec; 3) permanent memory on a magnetic drum, capable of data readout only, capacity 2048 terms, average rotation period 10 msec; 4) magnetic tape with a capacity of 100,000 terms. The computer operates on a frequency of 25 kc, power consumption is 3 kw, output rate 20 terms/sec. A total of 39 commands can be performed; the unit operates at an average speed of 1500 operations per second. The unit employs semiconductors (4000 triodes), an integrator in the form of a trigger register with a continuous carry and without provision for shifts and a data input system either from a manual keyboard or via a tape reading photoinput system. The unit occupies 50 m<sup>2</sup>. Bibl. with 7 titles, 1 illustration. N. S.
